

Hostinger Re-Import Safety Guide

Prepared for the Travel Agency Operations deployment so the production database can be restored safely and verified immediately after import.

Before Import

- Keep **u468486948_Travel_agency (2).sql** as the trusted source dump.
- Confirm the server **.env** points to the exact target database name, user, and password.
- If possible, avoid importing over a messy or partially repaired production database.

Best Option: Fresh Database

- Create a fresh empty database in Hostinger.
- Update the production **.env** with the new database name, username, and password.
- Import the dump into the fresh database.
- Test the application completely before retiring the old database.
- Keep the old database untouched until the new one is confirmed working.

If Reusing the Same Database

- Take one last emergency export from Hostinger first.
- Drop all existing tables from the target database.
- Confirm the database is empty.
- Import the dump and wait for the import to finish fully.
- Do not close the browser tab or interrupt the import process.

Post-Import Verification

Run this query immediately after import. Expected result: **0 rows**.

```
SELECT TABLE_NAME, COLUMN_NAME, COLUMN_KEY, EXTRA
FROM information_schema.COLUMNS
WHERE TABLE_SCHEMA = 'u468486948_Travel_agency'
AND COLUMN_NAME = 'id'
AND COLUMN_KEY = 'PRI'
AND EXTRA NOT LIKE '%auto_increment%';
```

Additional Verification Queries

Run the following checks after the zero-row result above:

```
SHOW TABLES;
SELECT COUNT(*) FROM migrations;
SHOW CREATE TABLE travelers;
SHOW CREATE TABLE auth_login_attempts;
SHOW CREATE TABLE customer_receipts;
```

Test Order

- Open the health URL and confirm the application, database, migrations, and storage all report **ok**.

- Test launcher login.
- Create a customer profile.
- Create a booking.
- Save a service line.
- Save a receipt with amount **0**.
- Print the receipt.

If Import Fails Midway

- Stop using that database immediately.
- Create a fresh empty database.
- Import the trusted dump again into the fresh database.
- Do not continue repairing random tables one by one unless absolutely necessary.

Important Reminder

The previous production issues were caused by broken schema after import, especially missing **AUTO_INCREMENT** on primary key **id** columns. A successful import is not considered safe until the verification query returns zero rows.
